

Figure 1: Mean (+/- S.E.M.) mechanical paw withdrawal threshold measurements across the test period for vehicle (n=10) and Taxol (n=10) treated animals. Animals were injected i.p. with 1 mg/kg Taxol. Taxol injections occurred every other day thereafter for 7 total injections. Animals were tested for MPWT value alterations approximately 23 hours post injection. Analysis indicated that relative to vehicle treated animals, Taxol treated animals showed decreased threshold values by Day 1, with maximum differences observed by Day 9. ** = p<.01
